

MyQuoteMate — Project Summary

Overview

MyQuoteMate is a web-based AI decision-support platform for Australian homeowners. It analyzes tradie/contractor quote PDFs and explains them in plain English, helping users identify inclusions, omissions, pricing signals, risks, and next steps before committing to a contractor.

Core Capabilities

- PDF upload and secure storage (text-based and scanned PDFs).
- OCR fallback for scanned documents with confidence handling.
- AI-driven extraction of scope, costs, inclusions/exclusions.
- Risk and red-flag detection (vague wording, missing items, payment risks).
- Relative pricing signals using typical market ranges (not legal or financial advice).
- Actionable questions users should ask contractors.

Monetization & Tiers

- **Free:** Plain-English summary only; no PDF; limited retention.
- **Standard (Paid):** Full single-quote analysis, red flags, recommendations, PDF download.
- **Premium (Paid):** Everything in Standard plus 2–3 quote comparison, deeper insights, priority processing.

User Flow

- Upload quote → enter email → view free preview.
- Paywall enforced → Stripe payment → instant unlock.
- PDF download enabled → account auto-created post-payment.

Technical Architecture

- Stateless backend with async job processing for OCR and AI analysis.
- Relational database (PostgreSQL) with JSONB for AI results.
- Secure object storage for PDFs with time-bound access.
- Stripe pay-per-report integration with webhook verification.

Data, Privacy & Compliance

- Clear separation of leads vs users; strict job ownership enforcement.
- Short retention for free-tier data; longer retention for paid users.
- Early deletion of raw PDFs; results retained per policy.
- Supplier intelligence is internal-only and never exposed.
- Compliance-aligned with Australian Privacy Principles.

AI Guardrails

- Decision support only; no legal or financial claims.
- Cautious, evidence-based language; no defamation or intent attribution.

- OCR uncertainty treated as a risk signal.

MyQuoteMate is designed as a production-ready SaaS MVP with strong UX, ethical AI use, clear monetization, and a scalable backend foundation.
